

79. Another finding of the research is related to the electroencephalogram (EEG) that was done while the participants were sleeping and exposed to the replay of the words, which revealed

- A) activation of brain areas not related to memories.
- B) the type of brain activity going on: memory of objects or of scenes.
- C) a huge net of synapses never registered when a person is sleeping.
- D) a type of neuronal activity usually associated with dreams.

Assunto: Interpretação textual e vocabulário

A sigla “EEG” facilita a localização do parágrafo-resposta (parágrafo 11). Aqui encontramos o resultado deste exame de imagem (“the EEG sleep spindle patterns “told” the researchers...). Na mesma linha, encontramos palavras comuns à pergunta e à opção B como “memories”, “objects” e “scenes”. Sendo assim, a opção correta é a opção B.

Item B
